

## Earthworks Validation

Enverity is able to provide a comprehensive geotechnical consultancy service which includes the assessment, design, supervision and validation of earthworks projects from Ground Investigation to completion of construction. With our in-house testing expertise, we are able to provide on-site and laboratory testing on a wide range of civil engineering construction materials, which when linked with our in depth understanding of modern civil engineering, provides our clients with an invaluable service.

The level of service can be tailored to the requirements of individual clients and contract specific, ranging from an initial assessment of suitability of the material at site investigation stage, to a complete package that includes all stages of the construction process. The complete package including the design, specification, supervision and validation would be completed with the issue of an earthworks validation report.
